

This website is designed for uses to create a patient portal account for Kona Clinic.

The main improvements I made from hw2 include displaying error messages for the first name, last name, and city fields when they are left blank or they use incorrect characters. The review field now displays whether the input for each field is valid or invalid so the user knows what they need to fix. The ssn field now restricts the user to 9 characters so they only have to input the numbers, and the dashes will be formatted automatically. I also disabled the submit button until the user clicks the validate button and the website checks the input making sure everything is valid.

Some parts of the website can still be improved. If a field is invalid and the user later corrects it, they must manually click the Validate button again before the Submit button becomes enabled. Making the validation update automatically as the user enters information would provide a smoother user experience.

Pseudocode below ->

Set valid to TRUE

Validate First Name

IF invalid

Set valid to FALSE

Validate Middle Initial

IF invalid

Set valid to FALSE

Validate Last Name

IF invalid

Set valid to FALSE

Validate Date of Birth

IF invalid

Set valid to FALSE

Validate Social Security Number

IF invalid

Set valid to FALSE

Validate Address Line 1

IF invalid

Set valid to FALSE

Validate City

IF invalid

Set valid to FALSE

Validate ZIP Code

IF invalid

Set valid to FALSE

Validate Phone Number

IF invalid

Set valid to FALSE

Validate Email Address

IF invalid

Set valid to FALSE

Validate Username

IF invalid

Set valid to FALSE

Validate Password

IF invalid

Set valid to FALSE

Validate Confirm Password

IF passwords do not match

Set valid to FALSE

IF valid is TRUE

Enable Submit button

ELSE

Disable Submit button

END
