

This website is designed for uses to create a patient portal account for Kona Clinic.

The main improvements I made from hw1 include automatic formatting of ssn where the patient is no longer required to add dashes in the input for the website to register a valid ssn. The phone number field is also improved so that if the user enters more than 10 digits, the website will take only the first 10 digits entered and discard the rest. Additional validation has been added across multiple fields including email, ZIP code, address line 1, username, password, and SSN, with clear error messages displayed when requirements are not met. The password field has been improved so that it shows requirement rules that disappear once each condition is satisfied, helping users create a valid password more easily. I also added a review button that displays the information that the user has entered.

Some parts of the website can still be improved. The first name, last name, and city fields currently do not display error messages when they are left blank, even though they are required fields. The review section also displays all entered information but does not indicate whether each field is valid or invalid based on the validation rules. In addition, the SSN field currently shows an error message when more than 9 digits are entered instead of automatically removing the extra digits as intended. The ssn, zip code, and phone number fields still allow the user to input letters instead of restricting the input to only numbers.
